

A method of call acceptance in a telecommunications cell comprising the step of providing for each requesting call a quality of service descriptor specific to that call, and accepting that call only when the required quality of service can be provided and also the required qualities of service of existing calls will not be unacceptably affected.

The method according to Claim 1 in which the quality of service descriptor a service degradation descriptor which specifies a preferred type of degradation of quality of service.

- The method according to Claim 2 in which the service degradation descriptor specifies acceptable decreases in jitter and bit error rate, and the order in which such decreases are to be applied.
- 4. The method according to Claim 3 in which there is also provided a second quality of service descriptor specific to each requesting call comprising a seamless service descriptor which specifies a preferred quality of service during a handover from one telecommunications cell to another.
- 5. The method according to Claim 4 in which the seamless service descriptor specifies quality of service on handover by specifying bandwidth requirements.

A wireless mobile telecommunications network comprising a core network, a plurality of base stations and a plurality of mobile terminals, there being a connection admission controller, a policer unit and a scheduler, comprising means to specify at least one quality of service descriptor specific to a requesting call, and in that the connection admission controller is arranged to accept the requesting call only when the quality of service in the descriptor can be provided, and the qualities of service descriptors specific to existing calls will not be unacceptably affected.

7. A network according to Claim 6 in which the connection admission controller comprises a Boolean decision maker and a connection impact evaluator arranged to assess the impact of accepting a requesting call into an active telecommunications cell.
